Preparation | Model Establishment | Sensitivity Analysis

Detail Workflow

Preparation

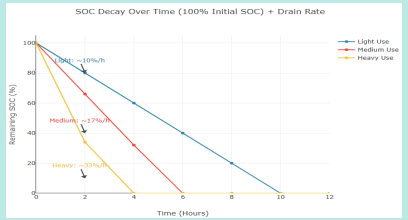
identify the research subject :the endurance of smart phone battery

improve the backwards existing methods

Describe the changes by differential equations

Continuity algorithm

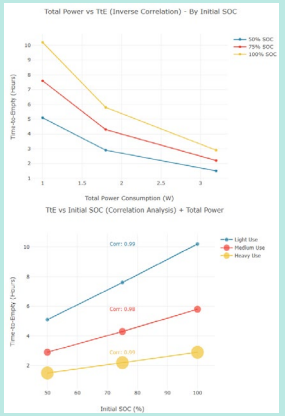
Model I: Dynamic state model of battery based on coupled differential equations



1.Equivalent circuit model (ECM) construction.
2.Thermal coupling model.
3.Terminal voltage output equation.
4.Numerical solution fourth-order Runge-Kutta method (K4).

Model II: TTE prediction model based on stochastic process

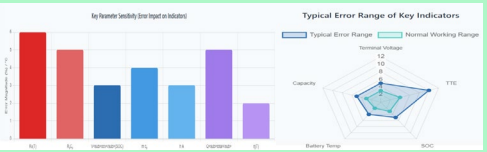
1.Multi-scene power decomposition framework.
2.Continuous-time Markov chain (CTMC).
3.Monte Carlo simulation.
4.Termination condition definition: adopt double criterion



Sensitivity Analysis

Calculate the normalized sensitivity index for the parameter perturbation experiment.

The achievement of full-link modeling from battery micro-dynamics to macro-range prediction



The Sobol index variance decomposition quantifies the contribution of the parameters to the variance
